Konstanz, 08.10.2014

Assignments 4 & 5

„Geometric Modeling“

Deadline 17.12.2014, F033.

Framework for the assignments:
Download the zip-file for the assignments from the web page of the course:

- The file `glwidget.cpp` contains a framework, for the required implementations. Comments mark the relevant lines in the code.
- The framework is based on OpenGL and Qt. The zip-file contains a Qt-project-file (.pro), which can be opend using the Qt-menu of VisualC++. It contains an executable framework including a GUI, see Figure 1.

The functionality of your implementation will be tested using the source code!

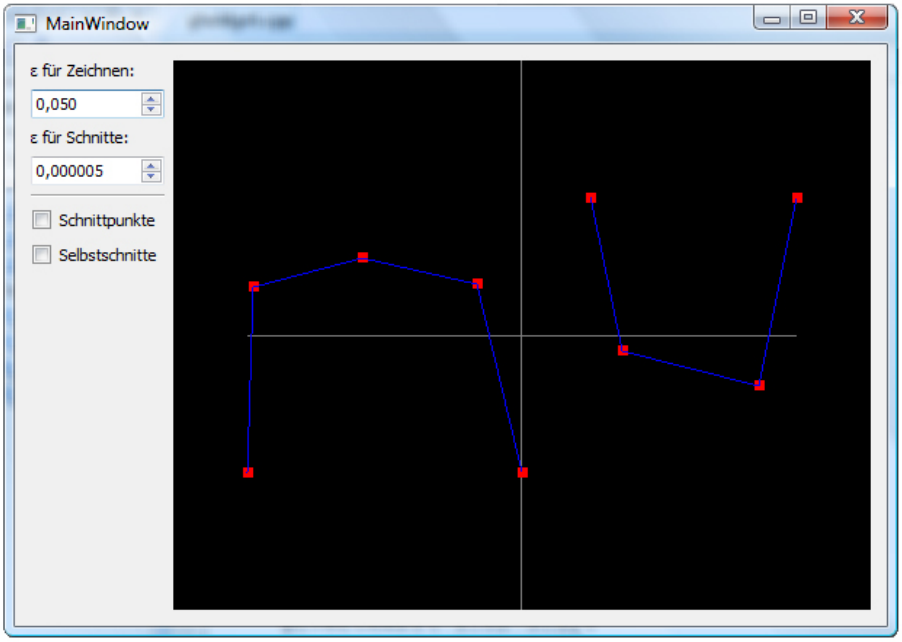

Figure 1 The GUI of the framework for assignments 4 and 5.

Assignment 4 (Bézier-curves: drawing, intersections, self-intersections)

Integrate three functions into the framework:

a. Implement a function to draw Bézier-curves. The control points of two Bézier curves are pre-defined in the framework. Use `epsilon_draw` for the termination condition.

b. Implement a function to compute all intersections of two Bézier curves. `epsilon_intersection` for the termination condition.

c. Implement a function to compute all self-intersections of a Bézier curve.

Assignment 5 (Bézier-curves: C^k-transitions)

Implement a function that computes for a given Bézier curve of degree n and one additional point a new Bézier segment with a C^{n-1}-transistion. The additional point is the end point of the new segment.

Deadline 17.12.2014, F033.
